

AI WORKPLACE PRODUCTIVITY ASSISTANT

Student: Aamina Mongwe **Programme:** AI Skills Acceleration Programme **Date:** 17 September 2026

Problem Statement

Professionals spend valuable time on repetitive tasks such as drafting emails, summarizing meetings, planning schedules and researching information. The project addresses this problem by creating an AI-powered assistant that simplifies these activities while maintaining human review, privacy and responsible AI use.

Solution Overview

The AI Workplace Productivity Assistant combines four functions in one interface: (1) Smart Email Generator, (2) Meeting Notes Summarizer, (3) AI Task Planner/Scheduler, and (4) AI Research Assistant. The solution exceeds the requirement of at least three features and is designed for practical workplace use.

Tools Used

ChatGPT and/or Google Gemini for AI generation, prompt testing and refinement; HTML/CSS/JavaScript for the interface; and GitHub/GitHub Pages for project presentation and hosting where appropriate.

Sample Prompts

Email: Act as a professional workplace communication assistant. Write a concise formal email to my manager requesting an extension for a project deadline. Include a subject, greeting, reason, proposed deadline and professional closing. Do not invent information.

Meeting: Analyze the meeting notes and produce Summary, Key Points, Decisions, Action Items, Responsibilities and Deadlines. Only use information contained in the notes.

Tasks: Organize my tasks according to urgency and importance and create a practical daily or weekly schedule. Use only supplied deadlines.

Research: Explain the supplied topic simply, provide key ideas and identify information that should be verified.

Prompt Engineering Approach

Prompts were refined by adding role, context, task, audience, tone, constraints and output format. A basic prompt is compared with an improved prompt to demonstrate how clearer instructions can improve output quality and consistency.

Challenges and Solutions

Challenge	Solution
General or incomplete AI responses	Add context, role and output requirements.
AI inventing missing details	Explicitly instruct the AI not to invent information.
Inconsistent formatting	Specify a fixed output structure.
Incorrect information	Require human verification and source checking.
Privacy concerns	Warn users not to enter confidential or sensitive information.

Responsible AI and Impact

The assistant addresses privacy, accuracy, bias, transparency and human oversight. The recommended workflow is Generate → Review → Verify → Edit → Approve → Use. Productivity impact should be measured by comparing actual manual and AI-assisted completion times while also evaluating output quality.

Assessment Alignment

Criterion	Weight	Evidence
Problem Relevance	20%	Real workplace productivity problem.
Prompt Engineering	25%	Structured prompts and iterative refinement.
Functionality	25%	Four practical AI features and testing.
Innovation	15%	Unified multi-function workplace assistant.
Responsible AI	10%	Privacy, limitations, bias and human review.
Presentation	5%	Professional slide deck and live demo.

Conclusion

The project demonstrates a practical use of AI to support workplace productivity. It combines prompt engineering, functional AI features, innovation and responsible AI practices while keeping human judgment and accountability at the center.
